

Paired Prototype

Description

Your assignment is to create a simple prototype with your paired team. You'll design and implement one mechanic, based on the genre + twist framework we've talked about in class. This prototype should be finished and playable via a hosted WebGL link (GitHub Pages).

For this assignment you're **not allowed to use any external assets**. Use of them will result in significant penalties. If you want to use ChatGPT or some other AI authoring tools, you'll first need approval from one of the course producers/graders and its usage must be documented.

This assignment is due **10/02/2026 12:59 PM (Before class)**. You'll submit your descriptive document to the appropriate assignment portal on Brightspace. We won't accept Unity Play or broken web links at the time of submission, so make sure your hosting works well before you submit it!

For the submission to be considered on time, **both** the Brightspace and Discord submission must be submitted before the due date. Otherwise, a late penalty will be incurred of 10%/day.

Descriptive Document Example: [Section 2 - Paired prototype Reference.pdf](#)

Good luck and have fun!

Details

Worth 10% of the final grade

Paired Prototype (100 pts)

- **Descriptive document (40 pts)**

Descriptive document detailing your prototype and its development

- **Logline (Genre + Twist) (2 pts)**

Start with a clear one-sentence description combining genre and twist (Genre + Twist)

Example: "A 3D-platformer game where you switch between first and second person perspective to traverse the level (Platformer + Perspective Switching)."

- **Genre tropes research and twist (15 pts)**

- Research at least three games from the genre and identify what they share in common (tropes) **(9 pts)**
 - Come up with a twist and justify that it is innovative based on the genre research **(6 pts)**

- **Short Prototype description (4 pts)**

Describe your game in 2-3 sentences, including the player's mechanics, their goal, and how the mechanic adds complexity to the gameplay for the user.

***Note:** The description of your prototype should not mention anything about a story*

- **Mechanic Matrices - Twist & Mechanics Matrix (5 pts)**
Fill out a single row of the Twist & Mechanics Matrix for the core mechanic of your prototype. Refer to the "Designing Around a Twist" lecture from Week 3 for examples
- **GitHub repository listed for the project (2 pt)**
- **Individual contributions listed (6 pts)**
We don't expect each person to work on every part of everything, but we want to see significant contribution, particularly in coding and design, from everybody.
- **At least one sketch or diagram (6 pts)**
 - Possible examples: Level diagram, mechanic flowchart, game loops
- **Playable build (15 pt)**
 - Hosted on GitHub Pages (not Unity Play)
 - Needs to be hosted and functional at the time of submission
- **The prototype works as described (25 pts)**
 - **Prototype is playable (15 pts)**
 - Functions without bugs and glitches
 - Implemented mechanic matches genre/twist, logline, and description **(10 pts)**
- **Gameplay video (10 pts)**
 - Clearly illustrates mechanic in under a minute
- **Discord marketing (10 pts)**
You'll post a similar description of your prototype to the Discord paired-prototype-presentations channel.
 - Links to gameplay video (No more than one minute), descriptive document, and online playable **(2 pts)**
 - Logline (genre + twist) **(2 pts)**
 - Description of prototype **(2 pts)**
 - Controls description **(2 pts)**
 - Names of team members **(2 pts)**

You will have the opportunity to do a short pitch presentation of your prototype in front of the class.

Notes:

Conciseness and Irrelevant Information

We encourage keeping the GDD document concise and to the point. Please refrain from excessively verbose walls of text or redundant and irrelevant information. Please still ensure enough information to convey originality of ideas, etc. In extreme cases of redundant and

irrelevant information, such that grading becomes difficult, the teaching staff holds the right to deduct points.

Addressing Bugs and Functionality

Points may be deducted for bugs or poorly implemented functionality at the discretion of the teaching team. While we don't expect a high degree of polish and perfection from a two-week paired prototype, we expect that your mechanic at least functions as described consistently.

Teamwork Evaluation

We want to foster a collaborative and balanced team environment. As such, the teaching team reserves the right to deduct points if an imbalance in teamwork is identified during the evaluation process.
